

mcp_server/

The ArtHound MCP server — exposes canonical production data (PAW) to external AI agents over the Model Context Protocol, mounted at `/mcp` in `main.py` (FastMCP, Streamable HTTP), scoped per-org under RLS.

Canonical documentation lives in [docs/mcp.md](#) — connecting, identity & scoping (model A1), key management (`scripts/agent_keys.py`), rate limiting, errors, the full `paw_v1_*` tool catalog, UI surfacing, and versioning. Design + phase history: [docs/plans/mcp-server.md](#).

Layout

- `server.py` — FastMCP construction (resource-server mode) + `build_mcp()`.
- `auth.py` — `AgentTokenVerifier` (API key → `lib/agent_auth.resolve_credential`).
- `context.py` — `tool_call` (scope enforcement + rate limit + audit + agent-identity binding).
- `shaping.py` — slot reads + `_META_HIDDEN` cleaner.
- `ratelimit.py` — per-credential token bucket.
- `tools/` — the tool implementations (`products` , `assets` , `work` , `estimates` , `schedule` , `timeline` , `writes`), registered with versioned names in `tools/__init__.py`.
